# Chapter 8

**SNMP** Management: RMON

## **Objectives**

- Remote network monitoring, RMON
- RMON1: Monitoring Ethernet LAN and token-ring LAN
- RMON2: Monitoring upper protocol layers
- Generates and sends statistics close to subnetworks to central NMS
- RMON MIBs for RMON group objects

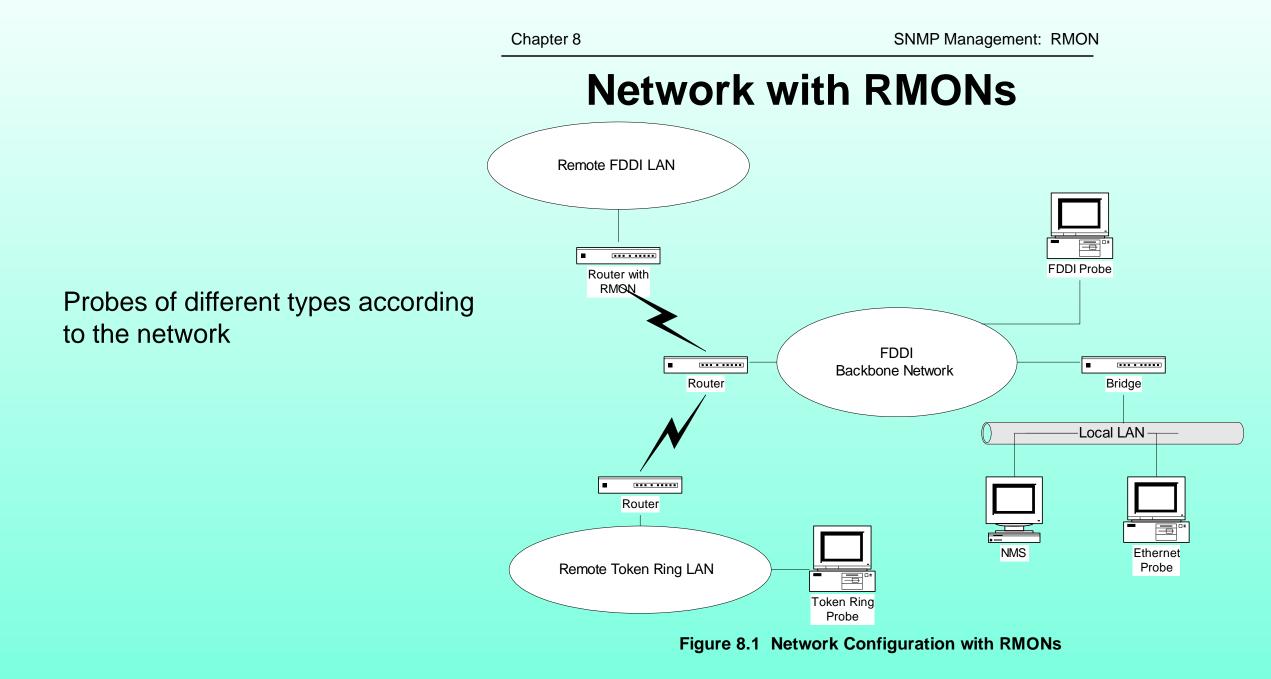

## **RMON Components**

- RMON Probe
  - Data gatherer a physical device
- Data analyzer
  - Processor that analyzes data

## Notes

RMON Remote Network Monitoring

### **Notes**

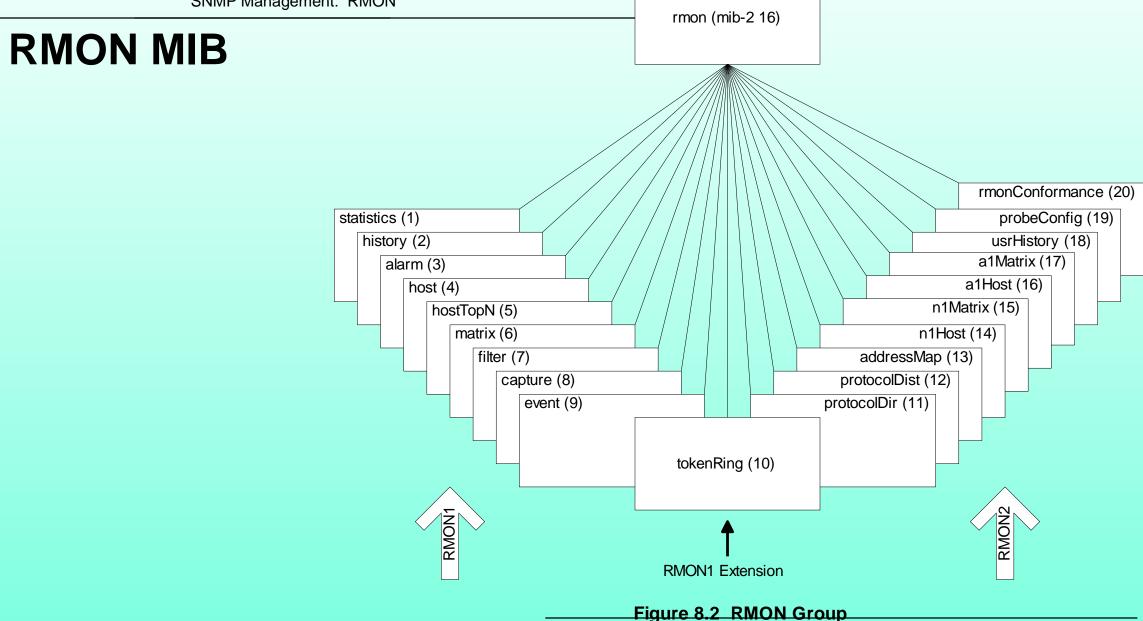

- Note that RMON is embedded monitoring remote FDDI LAN
- Analysis done in NMS

## **RMON Benefits**

 Monitors and (partially) analyzes data locally and relays it to the data analyzer/NMS : this results in less load on the network

- Needs no direct visibility by NMS; More reliable information
- Permits monitoring on a more frequent basis (because data is gathered locally) and hence faster fault diagnosis
- Increases productivity for administrators

### **Notes**

RMON1 is covered by RFC 1757 for Ethernet LAN and RFC 1513. There are two data types introduced as textual conventions, and ten MIB groups (rmon 1 to rmon 10), as shown in Figure 8.2.

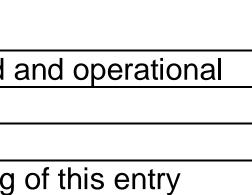

- RMON1: Ethernet RMON groups (rmon 1 rmon 9)
- RMON1: Extension: Token ring extension (rmon 10)
- RMON2: Higher layers (3-7) groups (rmon 11 rmon 20)

## **Row Creation & Deletion**

Table 8.1 EntryStatus Textual Convention

| State         | Enume- | Description                                      |
|---------------|--------|--|
|               | ration |  |
| valid         | 1      | Row exists and is active. It is fully configured |
| createRequest | 2      | Create a new row by creating this object         |
| underCreation | 3      | Row is not fully active                          |
| invalid       | 4      | Delete the row by disassociating the mapping     |

- EntryStatus data type introduced in RMON
- EntryStatus (similar to RowStatus in SNMPv2) used to create and delete conceptual row
- Only 4 states in RMON compared to 6 in SNMPv2

## Textual Convention: LastCreateTime and TimeFilter

Enhancements to RMON1 include :

 LastCreateTime: a standard textual convention that tracks changes of data and control

 Timefilter : a standard textual convention enables an application to download only those rows that changed since a particular time.

An additional descriptive label which may associated to some management information, these textual conventions can be applied to rows of tables

## fooTimeMark

- fooCounts.0.1 5 fooCounts.0.2 9 fooCounts.1.1 5 fooCounts.1.2 9 fooCounts.2.1 5 fooCounts.1.2 9 fooCounts.3.1 5 fooCounts.3.2
- 9 fooCounts.4.2 9
- fooCounts.5.2 9

### **Notes**

• Bold objects (fooTimeMark and fooIndex) are indices

### FooTable (bold indicating the indices):

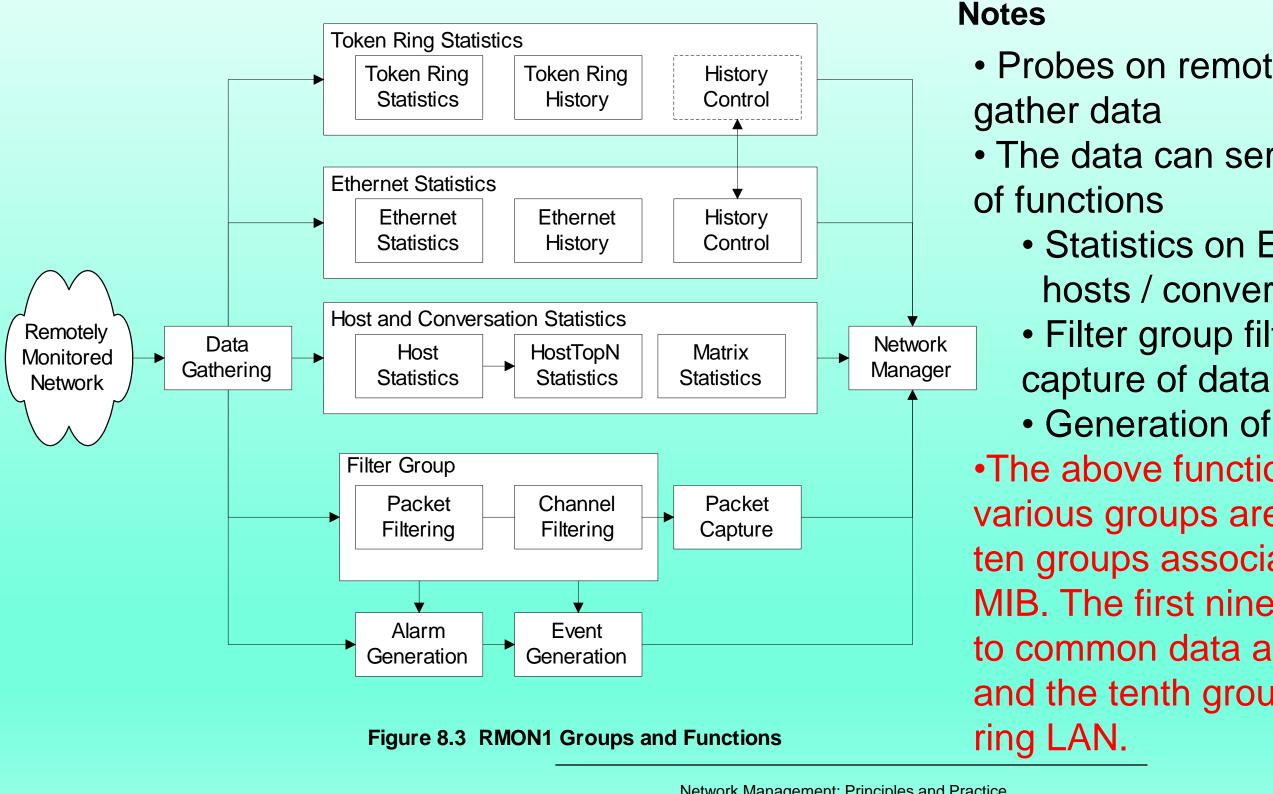

fooCounts foolndex

-- (Note that row #1 does not exist for times 4 & 5 since the last update occurred at time-mark 3.)

(Both rows #1 and #2 do not exist for time-mark greater than 5.)

Chapter 8

## **RMON Groups and Functions**

Probes on remotely monitored networks

• The data can serve as inputs to five sets

 Statistics on Ethernet, token ring, and hosts / conversations

• Filter group filters data prior to

 Generation of alarms and events •The above functions associated with the various groups are accomplished using ten groups associated with the RMON1 MIB. The first nine groups are applicable to common data and to Ethernet LAN,

and the tenth group extends it to token-

## **RMON1 MIB Groups & Tables**

| Chapter a | 8 |
|-----------|---|
|-----------|---|

| GROUP             | OID     | FUNCTION   | TABLES                |
|-------------------|---------|--|-----------------------|
| Statistics        | rmon 1  | Provides link-level statistics   | -etherStatsTable      |
|                   |         | <  | -etherStats2Table     |
| History           | rmon 2  | Collects periodic statistical data and stores<br>for later retrieval                         | -historyControlTable  |
|                   |         |  | -etherHistoryTable    |
|                   |         |  | -historyControl2Table |
|                   |         |  | -etherHistory2Table   |
| Alarm             | rmon 3  | Generates events when the data sample<br>gathered crosses pre-established<br>thresholds      | -alarmTable           |
| Host              | rmon 4  | Gathers statistical data on hosts  | -hostControlTable     |
|                   |         |  | -hostTable            |
|                   |         |  | -hostTimeTable        |
|                   |         |  | -hostControl2Table    |
| Host Top N        | rmon 5  | Computes the top N hosts on the<br>respective categories of statistics gathered              | -hostTopNcontrolTable |
| Matrix            | rmon 6  | Gathers statistics on traffic between pairs<br>of hosts                                      | -matrixControlTable   |
|                   |         |  | -matrixSDTable        |
|                   |         |  | -matrixDSTable        |
|                   |         |  | -matrixControl2Table  |
| Filter            | rmon 7  | Performs filter function that enables capture of desired parameters                          | -filterTable          |
|                   |         |  | -channelTable         |
|                   |         | (  | -filter2Table         |
|                   |         |  | -channel2Table        |
| Packet<br>capture | rmon 8  | Provides packet capture capability to<br>gather packets after they flow through a<br>channel | -buffercontrolTable   |
|                   |         |  | -captureBufferTable   |
| Event             | rmon 9  | Controls the generation of events and<br>notifications                                       | -eventTable           |
| Token ring        | Rmon 10 | See Table 8.3  | See Table 8.3         |

## Notes

ork Management: Principles and Practice © Mani Subramanian 2010

- Ten groups divided into three categories
- RMON2

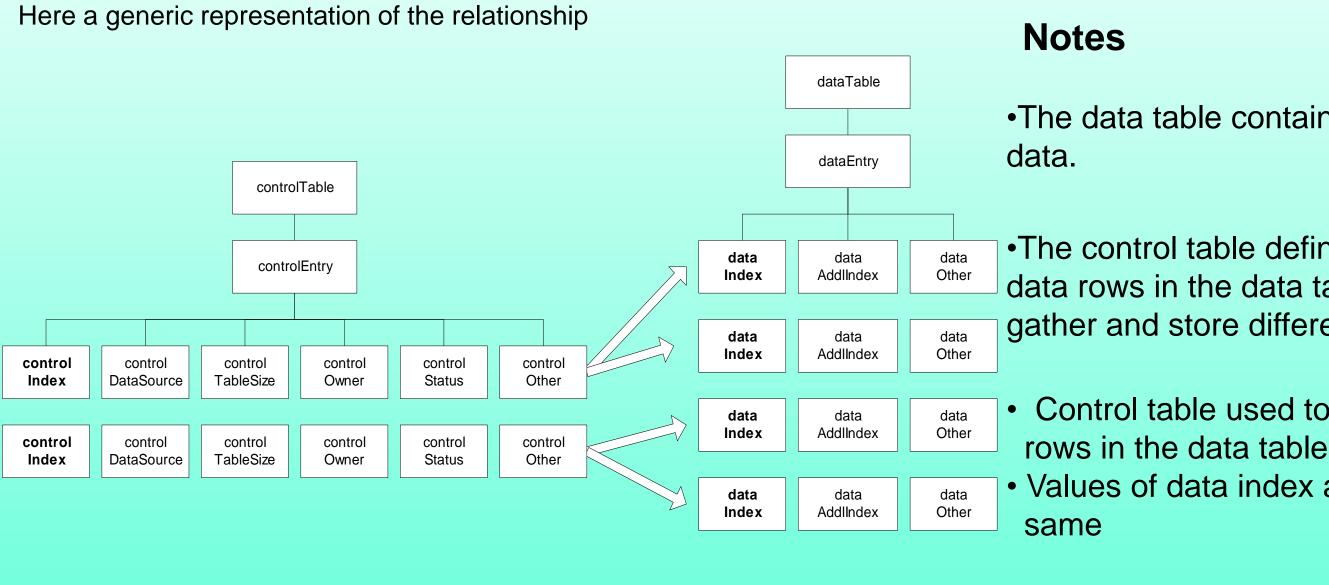

## •Table 8.2, notice several of the groups have a data table and a control table.

Statistics groups (rmon 1, 2, 4, 5, 6, and 10)
Event reporting groups (rmon 3 and 9) • Filter and packet capture groups(romon 7 and 8)

• Groups with "2" in the name are enhancements with

Chapter 8

## **Relationship between Control and Data Tables**

Note on Indices: Indices marked in bold letter Value of dataIndex same as value of controlIndex

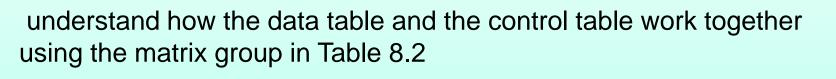

### **Figure 8.4 Relationship between Control and Data Tables**

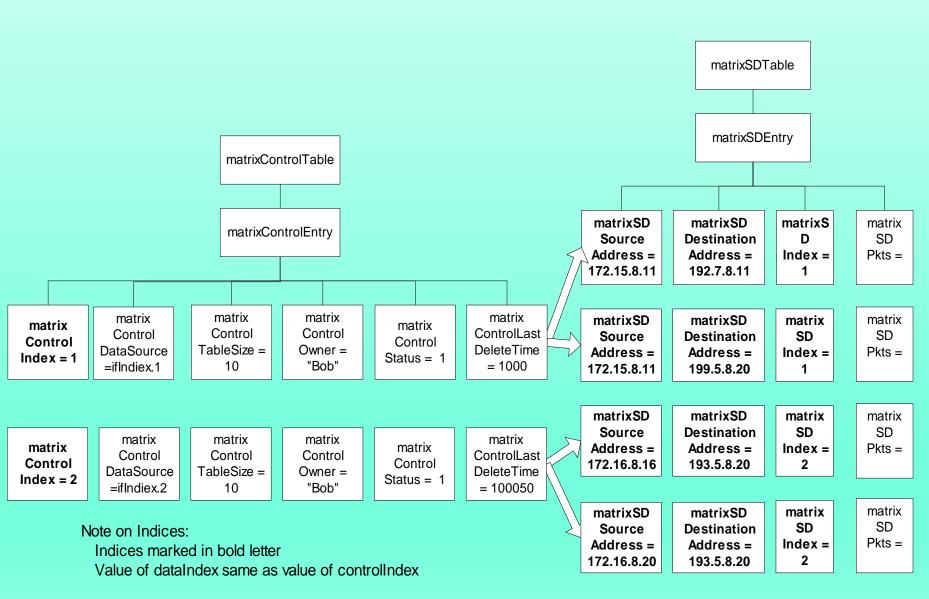

•The data table contains rows (instances) of

 The control table defines the instances of the data rows in the data table and is settable to gather and store different instances of data.

 Control table used to set the instances of data Values of data index and control index are the

# Matrix Control and SD Tables

## Notes

- interface of a managed entity.

 controlTableSize identifies entries associated with the data source In our MSD table example, this would be the source-destination pair in each row of the table.

or a management person.

 We can collect data based on source and destination addresses appearing in the packets on a given interface using the matrixSDTable (matrix source–destination table).

The control index is an integer uniquely identifying the row in the control table. It would have a value of 1 for the first

The value of the columnar object, controlDataSource, identifies the source of the data that is being collected. In our example, if the interface #1 belongs to the interfaces group, then controlDataSource is ifIndex.1.

 The controlOwner columnar object is the entity or person who created the entry. The entity could be either the agent or NMS,

•The controlStatus is one of the entries listed in Table 8.1.

## **Host Group**

- The host group contains information about the hosts on the network. It compiles the list of hosts by looking at the good packets traversing the network and extracting the source and destination
- MAC addresses. It maintains statistics on these hosts.
- There are three tables in the group: hostControl-Table,hostTable, and hostTimeTable.
- The hostControlTable controls the interfaces on which data gathering is done.
- The other two tables depend on this information. The hostTable contains statistics about the host.
- The hostTimeTable contains the same data as the host table, but is stored in the time order in which the host entry was discovered. This helps in the fast discovery of new hosts in the system.
- The entries in the two data tables are synchronized with respect to the host in the hostControlTable. We can obtain statistics on a host using this MIB.

# Host Top N Group Example

The host top N group performs a report-generation function for ranking the top N hosts in the category of the selected statistics.

For example, we can rank-order the top ten hosts with maximum outgoing traffic. The HostTopNControlTable is used to initiate generation of such a report.

As an example of the type of data that can be acquired using an RMON probe, Figure 8.5 shows a chart derived using an RMON probe for the output octets of the top ten hosts in a network. The names of the hosts have been changed to generic host numbers for security reasons.

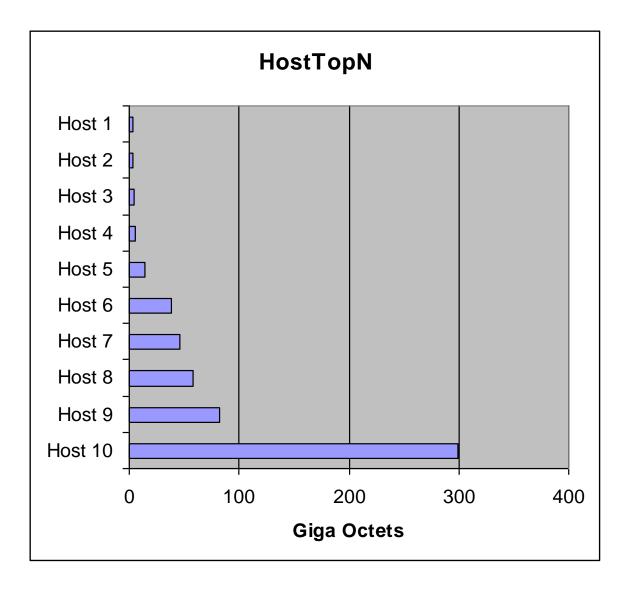

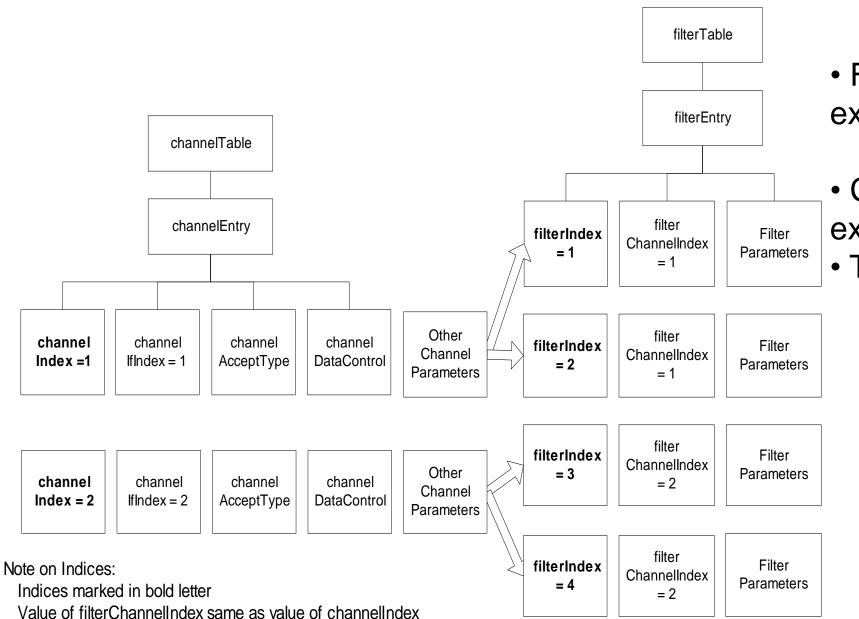

Figure 8.5 HostTop-10 Output Octets

## **Filter Group**

expressions

**Notes** 

- expression
- - filter table
  - passes the test
  - select packets to be captured.

## • Filter group used to capture packets defined by logical

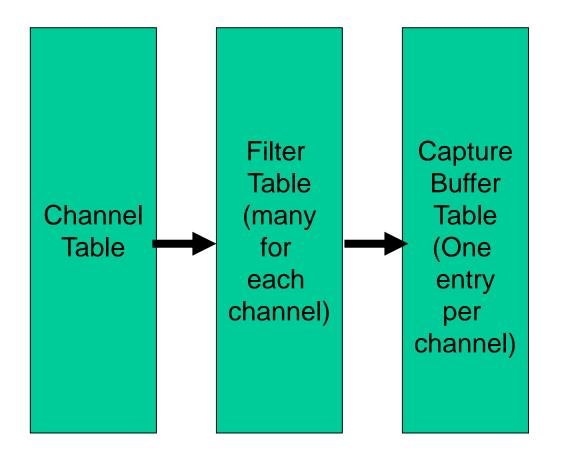

• Channel is a stream of data captured based on a logical

 The group contains a filter table and a channel table. Filter table allows packets to be filtered with an arbitrary filter expression, a set of filters associated with each channel. Each filter is defined by a row in the filter table. A row in the channel table associated with multiple rows in the

Capture table accepts data if test of any row in the filter table

- For each channel, the input packet is validated against each filter associated with that channel and is accepted if it passes any of the tests. A row in the channel table of the filter group includes the interface ID (same as ifIndex) with which the channel is associated, along with acceptance criteria. The combination of the filter and channel filtering provides enormous flexibility to

## **Packet Capture Group**

- filter group.
- The channel filter criteria for acceptance of the filter group output are  $\succ$ controlled by the bufferControlTable
- Each packet captured is stored in the capture buffer table  $\succ$ (captureBufferTable) as an instance.

## Notes

•Buffer control table used to select channels

> The packet capture group is a post-filter group. It captures packets from each channel based on the filter criteria of packet and channel filters in the

# **RMON Token-Ring Extension Groups**

### token-ring RMON MIB is an extension to RMON1 MIB and is specified in RFC 1513

### Table 8.3 RMON Token-Ring MIB Groups and Tables

| Token Ring Group       | Function                                | Tables                        |     |
|------------------------|---|-------------------------------|-----|
| Statistics             | Current utilization                     | tokenRingMLStatsTable         |     |
|                        | and error statistics of MAC Layer       | tokenRingMLStats2Table        |     |
| Promiscuous Statistics | Current utilization                     | tokenRingPStatsTable          |     |
|                        | and error statistics                    | tokenRingPStats2Table         |     |
|                        | of promiscuous                          |                               |     |
|                        | data                                    |                               |     |
| MAC -Layer History     | Historical                              | tokenRingMLHistoryTable       |     |

### Notes

- Two statistics groups and associated history groups
  - etc.
  - packets of various sizes and the type of packets •There are two corresponding history statistics groups—current and promiscuous. Each of the four statistics groups has one data table associated with it.
- Three groups associated with the stations - The ring station group provides statistics on each station being by the ringStationControlTable.
  - monitored rings and has only a data table.
- The source-routing group. It is used to gather statistics on routing nformation in a pure source-routing environment.

• MAC layer (TR Statistics group) collects TR parameters: data on tokenring parameters such as token packets, errors in packets, bursts, polling,

• Promiscuous Statistics group addresses statistics on the number of

monitored on the ring along with its status. The data are stored in the ringStationTable. The rings and parameters to be monitored are controlled

-The ring station order group provides the order of the station on the

-The ring station configuration group manages the stations on the ring.

## RMON2

- Applicable to Layers 3 and above
- Functions similar to RMON1: Several of the groups and functions in RMON2 at higher layers are
- similar to that of the data link layer in RMON1.
- Enhancement to RMON1
- Defined conformance and compliance

### Table 8.4 RMON2 MIB Groups and Tables

| Group                        | OID     | Function  | Tables  |                           |

## **Notes**

**RMON2 MIB** 

- RMON2 MIB is arranged into ten groups.
- probe can be altered by reconfiguring the control layer to the application layer.

 $\succ$  The architecture of RMON2 is the same as RMON1.

> The protocol directory group is an inventory of the protocols that the probe can monitor. The capability of the protocolDirTable. The protocols range from the data link

# A CASE STUDY ON INTERNET TRAFFIC USING RMON

- A study at Georgia Tech on Internet traffic
- Objectives
  - Traffic growth and trend
  - Traffic patterns
- Network comprising Ethernet and FDDI LANs
- Tools used
  - HP Netmetrix protocol analyzer
  - Special high-speed TCP dump tool for FDDI LAN
- RMON groups utilized
  - Host top-n
  - Matrix group
  - Filter group
  - Packet capture group (for application level protocols)

## **Case Study Results**

**1.** Growth Rate: Internet traffic grew at a significant rate from February to June at a monthly rate of 9% to 18%. February to March 12% March to April 9% April to May 18%

Note: There is sudden drop in June due to end of spring quarter and summer quarter starting.

- 2. Traffic Pattern:
- **Monthly / Weekly:** Only discernible variation is lower traffic over  $\bullet$ weekends
- **Daily:** 2/3 of the top 5% peaks occur in the afternoons ullet

### **Users**: $\bullet$

| Top six domain of users | (96%) are |
|-------------------------|-----------|
| Domain 1                | 20%       |
| Domain 2                | 30%       |
| Subdomain 1 (25%)       |           |
| Subdomain 2 (3%)        |           |
| Domain 3                | 34%       |
| Domain 4                | 7%        |
| Domain 5                | 3%        |
| Domain 6                | 2%        |

Top three hosts sending or receiving data Newsgroups Mbone Linux host

### What we have learned :

- **1.** The three top groups of users contributing to 84% of the Internet traffic are students (surprise!), Newsgroup services, and Domain 1.
- 2. Growth rate of Internet during the study period in spring quarter is 50%.
